# Your No. 1 pest control tool

AllPro Pest Management tackles every job with the indispensable Ensystem Dual Power Light

Randy Bishop has been in the pest control industry since he was 18 years old. After working his way up through a variety of positions, he eventually founded his own company, family-operated AllPro Pest Management in Charleston, S.C.

Now, at 61 years old, Bishop's involvement in the industry has helped him stay up-to-date with the newest technologies and product solutions in pest control. He has served on the boards and been involved with the Greater Charleston Pest Control Association and the South Carolina Pest Control Association. He relies

on products that make a difference during inspections, including the Dual Power Light from Ensystem.

AllPro has been using Ensystem products for more than 20 years, starting with Exterra, its flagship termite baiting system. Bishop says AllPro has also seen success with Bithor SC by Ensystem for mosquito control.

Now, Bishop says he uses the Ensystem Dual Power Light for each job. "I've used mine for everything," he

says. "Making inspections of course, including rodent, bed bug and general pest control."

AllPro's clientele is half commercial and half residential accounts — including apartment units.

Not only does Bishop use the Dual Power Light for treating accounts, but he made sure that the three other pest technicians at AllPro have the flashlight as well. "What I've always said is your No. 1 tool is your flashlight. You can't treat what you can't see," he says.

The flashlight, which is both waterproof and drop proof, has both an ultraviolet (UV-A) power and a LED power light. Bishop says the Dual Power Light is used for all indoor applications and inspections at AllPro. "It's my go-to light. You can look at a substance or an item with both lights and get better insight," he adds.

The dual-function flashlight is also small enough to carry on a belt, which provides easy access for any situation. "The light holds a long enough charge,

and it's convenient in a pouch on your side," Bishop says.

Using the UV-A light, Bishop and his techs are able to illuminate the urine of rodents.

During one rodent treatment, Bishop shares that a technician was able to track the rodent's territory because of the illuminated droppings and urine: "Because we were able to see the rodent's territory, we were able to set traps and bait stations more accurately." As a result, they were able to eliminate harborage and gain control.
